AMENDMENTS TO THE SPECIFICATION

Please amend paragraph on page 9 line 17 as follows:

Network ~~server 160~~ server 162, which may be a web server or application server, is configured to receive a request for a virtual book from user 160. In this embodiment the user may initiate a request by submitting a search for a particular topic, phrase or key word(s). When the request is received, the topic for the virtual book is passed to database 152. Stored procedures within the database, or procedures executed by a database server operating in conjunction with the database, assemble the virtual book by categorizing the stored headings and/or other entities (if they are not already categorized). The headings within a category may be ordered according to their relevance to the topic and/or category, in alphabetical order, in the order they appear in the documentation, or according to some other ranking. Links are established from the headings to their corresponding documentation portions so that the user may easily access the pertinent text when he or she selects a heading.
